UNIT OF MEASURE MANAGEMENT

Products come packaged in many shapes and sizes. Buying by the pallet, counting by the case, selling by the carton or even individually, and at the end of the day users need to look at sales performance in one consolidating unit, perhaps tonnage, litres or cases. The Myridas Unit of Measurement module directs the power of Microsoft Dynamics GP software to provide all of these facilities at the click of a button.

Key Features

Main Stock Unit Identification

This provides the facility to set a unit of measure other than the base unit as the unit in which items will be viewed. The main stock unit is the unit of measure most appropriate for viewing stock balances and transactions, so that all departments are viewing meaningful and relevant figures. This can be overridden on an item by item or window by window basis as required.

Sales Consolidation Unit Identification

In many businesses the comparative volume of sales year on year provides a better measure of performance than revenue or margin, as prices may fluctuate from year to year. For wine merchants it's cases; for a paper merchant it's tonnage. Whatever the market, this feature provides the facility to bring together sales information into a single meaningful unit that will provide invaluable sales performance information.

Split-pack Management

A user may be requested to sell 173 individual units on an item that is packed into cartons of 12. Rather than selling 14.416667 cartons on an item, the user can mark the item as a split pack item and sell 14/5 cartons, ie 14 cartons and 5 individual items.

Application Power

Stock Visibility

At any point any user can see stock levels in the terms that are meaningful to them. This applies across look-ups as well as on individual items so that, for example, in inventory look up during sales order entry the user can see stock in main selling unit whilst the warehouse manager may want to see the same look-up displaying the main stock unit.

Enhanced Sales Analysis

Touch of a button comparison between sales volumes year on year – the only true basis for measurement of sales activity performance level.

Split-Pack Visibility

Improved picking accuracy is possible as documentation will show actual quantities and units to be picked with no more decimal points or imperfect roundings.
